Overview

Web-scale data is challenging not only due to its size but also due to its language diversity. Existing Open Information Extraction systems primarily focus on a single language having a direct impact on employed methods and algorithms. In the theoretical part of this work you will examine existing cross-lingual or language-agnostic methods. Accompanying questions include: What makes these approaches language agnostic? Which language families do they support? The practical part of this work includes the application and evaluation of selected language-agnostic methods to social media texts written in English as well as German.
